### Mang is the Tiller for the Extra Tough Jobs

There are two kinds of tilling jobs. One is the quick and easy job that can be done by almost any tiller. The other is the tough job that works the life out of any but the strongest of tillers.

It is this second type of job that the Mang Tiller is designed and manufactured to handle. Whether it be the easy or the tough job, the Mang Tiller will take them in stride — and with less trouble and “down time” than any other tiller on the market. Because of its rugged construction, the Mang Tiller has been accepted as preferred equipment by operators in the rental field.

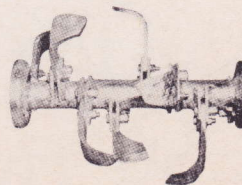

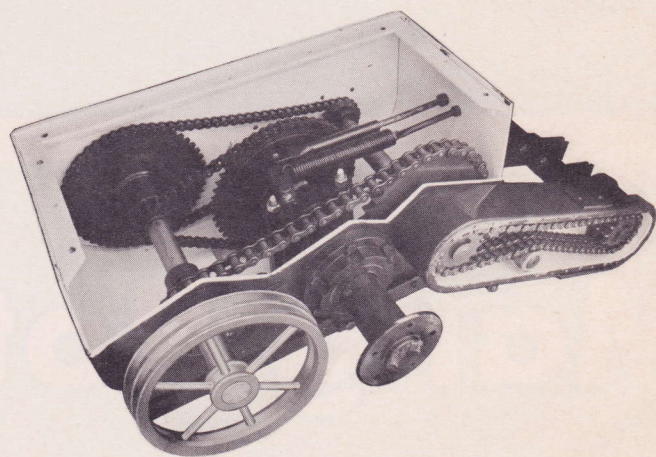

### Built for Extra Ruggedness

The illustration of the cutaway Mang Tiller gear box shows why this machine is so rugged. The strain and shock of the toughest tilling is distributed among the eight sprockets and the heavy duty roller chain, unlike most other machines where the strain is taken by only two or three gear cogs. All moving parts are sealed in oil to give trouble free performance.

Powered by a heavy duty air cooled engine, the tiller easily gives a full till width and the proper depth necessary for good soil preparation. The high speed rotary knives are made of high alloy steel for extra strength and long life.

### Easy to Maneuver

The Mang Tiller is among the shortest coupled of all tillers. Its short turning radius makes it ideal for the jobs where space is limited and which are difficult for most tillers to reach. Its automotive type differential and low center of gravity give it the maneuverability and stability that are hard to match. Model 95 has a throw out mechanism which allows the tiller to be moved under its own power without the rotor assembly operating.
